PROJECTS

Live Stock Portfolio Tracker

Python, PostgreSQL, Flask

- Building a full-stack paper-trading web app with a well-structured package architecture, letting users create accounts and trade stocks with virtual funds
- Designed a security-conscious data flow for an AI research feature: the client sends only a stock ticker, while the server supplies all price, position, and history data — keeping sensitive account data off the client entirely
- Defined behavior guidelines for the AI feature (factual only, no investment advice, explicit uncertainty over guessing) and evaluated its outputs against those standards — hands-on practice reviewing AI-generated responses for accuracy

GitHub Portfolio

github.com/AadhavanSiva

- Migrating past coursework and independent projects into a professional, well-documented portfolio
